

AI-Driven Development– 30-Day Challenge Task 7

“Task Overview”

What is SPECKit Plus?

SPECKit Plus is a structured AI-driven workflow that helps developers plan, design, and build projects step by step. It breaks a project into five clear phases so the developer can think, organize, and implement everything properly.

/constitution:

The Constitution phase defines the project’s purpose, goals, problem statement, stakeholders, and success criteria. It sets the foundation of the entire project.

/specify:

The Specify phase explains what the system must do. It includes functional requirements, input/output details, user needs, and error handling rules.

/plan:

The Plan phase outlines the steps to complete the project. It includes workflow planning, task breakdown, and a testing plan.

/tasks:

The Tasks phase lists all actionable steps needed to build the project. It divides work into small, manageable tasks.

/implement:

The Implement phase is where the actual coding or building happens. The project is executed according to the plan and tasks.
